                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (HR-1 receptor). This, or it's activators or agonists, can be used to treat, prevent or diagnose predisposition to lowered resistance to infection; asthma, allergic or haematopoietic disorders, e.g. where indured by acquired immune deficiency syndrome (AIDS), aplastic anaemia, neutrop, ania or cytotoxic treatments for cancer. Antagonists of the receptor, e.g. antibodies or fragments of it may be used to treat conditions associated with overexpression of the HR-1 receptor, e.g. hose listed above. Antibodies may also be used to assay levels of HR-1 receptor; overexpression of which may be diagnostic of tumours, by usual lummynoassays; to isolate and identify HR-1 receptor expressing cells; or finity purification of the HR-1 receptor.
invention relates to new purified peptides comprising 380 or 427 am acid sequences, which are receptors for interleukin-13 (II-13); the and 427 aa proteins are designated II-13R beta and alpha respective The II-13R beta has high affinity for II-13 while II-13R alpha has affinity, but acquire high affinity when associated with the II-4
                                                                                                                                                               SMEI ) SANOFI SA.

Cells that express IL-13R at the surface are used to identify ligands and modulators of IL-13R. Note: IL-13R beta is encoded by the nucleic acid sequence shown in Figure 2a in the specification (786464), which is not the same as that shown in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               such as loss of heterozygosity and rearrangements, or chromosomal anomalies. They are also used for production of recombinant II-13R beta and alpha which can be used as II-13 antagonists, specifically to regulate II-13-induced responses for treatment of inflammation and allergy. II-13 receptors are also useful as antisense molecules for gene therapy (blocking synthesis of II-13R). Antibodies are used (in standard immunoassays) to diagnose diseases associated with abnormal expression
                                                                                                                                                                                                     W09747741-A1.
                                                                                                                                                                                                                                                                 Protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human HR-1 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    W41520 standard; Protein; 380
                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens.

This protein comprises a novel human cytokine/peptide hormone receptor, designated the HR-1 receptor, that shows 27% identity and 52% similarity to the interleukin-5 receptor. Its amino acid sequence was deduced from a CDNA clone (see VQ1431) obtained from a channel form the expressed in claimed host cells, and used in a claimed method for identifying compounds which bind to, and activate or inhibit, it. HR-1 receptor activators and agonists can be used to treat, prevent or diagnose predisposition to lowered resistance to infection, asthma, allergic or haematopoletic disorders, e.g. where induced by AIDS, aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. HR-1 antagonists, e.g. antibodies or HR-1 receptor fragments, can be used to treat conditions associated with HR-1 receptor levels, since overexpression may be diagnostic of tumours.

Claim 1; Page 51-53; 79pp; English.

This sequence represents a novel ligand-binding receptor, Zcytor2, which

c shares homology with cytokine receptors and was isolated from a human

testis cDNA library. The resulting polypeptide is a receptor for

cytokines (particularly interleukin-13) and is expressed on the surface

of testicular cells, probably being involved in spermatogenesis. It can

be used to detect ligands that promote proliferation and/or

differentiation of such cells in cultures and may also be used to treat

infertility. Antagonists of this receptor may be used to characterise

ligand-receptor interactions and as male-specific contraceptives. By

blocking the action of IL-13, receptor antagonists and ligand-binding

this receptor can also be used to modulate immune function, e.g. in

allergy and asthma, as a diagnostic to determine circulating levels of

ligand and also to isolate and purify ligands. Antibodies can be used to

assay circulating receptor (an abnormal level may be indicative of

and theraponitically as antagonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

It can be used to detect ligands promoting proliferat and/or differentiation of such cells in cultures and may also be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of II-13, receptor antagonists ligand-binding this receptor can also be used to modulate immune function, s.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal leve may be indicative of disease such as cancer), for labelling cells that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and is isolated from testis tissue obtained from a Celebus macaque. The resulting polypept is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved

Example 14; Page 52-53; 69pp; English.

The IL-13 binding protein and related therapeutic molecules can be in the antagonism of at least one IL-13 activity. They can be used treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after treatment. The products can also be used as diagnostic agents, edetecting autoimmune diseases. The antibodies can also be used fundamenterapy and may also be used as a diagnostic tool.

They can be used for treating IL-13 mediated conditions such as cartain allergic conditions such as astima or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool. CC The present sequence represents the murine interleukin-13 (IL-13) binding CC chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a CC mediator of the known biological activities of IL-13. Recombinant CC IL-13bc proteins, and antibodies raised against them, are used to combinate the binding of IL-13 to its receptor. They are particularly used to treat IgE-mediated conditions, e.g. allergy, asthma and immune complex CC disorders, especially lupus, nephritis, thyroiditis and Grave's disease. CC They are also used to treat immune deficiency (particularly in CC haematopoietic progenitor cells), cancer etc., and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein CC with such activity is combined with IL-13bc and the mixture applied, CC in vivo, to a cell expressing at least one chain of the IL-13 receptor CC other than IL-13bc. IL-13bc can also be used in diagnosis to detect CC expression of IL-13, its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

            involving IL-5
Chaim 21; Page 42-44; 65pp; English.
Chaim 21; Page 42-44; 65pp; English.
The inventors claim: an isolated cDNA sequence encoding murine (secretory) interleukin-5 (IL-5) receptor, which is synthesised from murine early P cell mRNA; an isolated murine (secretory) IL-5 receptor; an isolated cDNA sequence encoding human (secretory) IL-5 receptor, which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human (secretory) IL-5 receptor. Also claimed are a COS monkey cell transfected with a recombinant vector contg. the DNA; secretory human IL-5 lacking a cytoplasmic and a contg. The DNA; secretory human IL-5 lacking a cytoplasmic and a contg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated interleukin-13 binding protein - used to develop products for therapy e.g. for allergic conditions such as asthma or for diagnosis or detection.

Claim 7: Page 44: 69pp: English.

The IL-13 binding protein and related therapeutic molecules can be used in the antaconism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as astima or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. fo detecting auroimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

The inventors claim: an isolated cDNA sequence encoding murine (secretory) interleukin-5 (IL-5) receptor, which is synthesised from murine early B cell mRNA; an isolated murine (secretory) IL-5 receptor; an isolated cDNA sequence encoding human (secretory) IL-5 receptor, which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human (secretory) IL-5 receptor. Also claimed are a COS monkey cell transfected with a recombinant vector contg. the DNA; secretory human IL-5 lacking a cytoplasmic and a

The inventors claim: an isolated cDNA sequence encoding murine (secretory) interleukin-5 (IL-5) receptor, which is synthesised from murine early B cell mRNA; an isolated murine (secretory) IL-5 receptor; an isolated cDNA sequence encoding human (secretory) IL-5 receptor, which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human (secretory) IL-5 receptor. Also claimed are a COS monkey cell transfected with a recombinant vector contg. the DNA; secretory human IL-5 lacking a cytoplasmic and a transmembrane region; and an expression vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human and murine interleukin-5 for treatment of auto-immune ar

Number of hits that pass the threshold :

1: pir1:*
2: pir2:*
3: pir3:*
4: pir4:* 142080

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ILIJR-ALPHA, AND POSSIBLY OTHER COMPONENTS.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: UBIQUITOUS, HIGHEST LEVELS IN HEART, LIVER,
SKELETAL MUSCLE AND OVARY; LOWEST LEVELS IN BRAIN, LUNG AND
KIDNEY. ALSO FOUND IN B-CELLS, T-CELLS AND ENDOTHELIAL CELLS.
SIMILARITY: CONTAINS' I IMMUNOCLOBULIN-LIKE C2-TYPE DOMAIN.
SIMILARITY: CONTAINS 1 FIBRONECTIN TYPE III-LIKE DOMAIN.
SIMILARITY: BELONGS TO THE CYTOKINE FAMILY OF RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EUNCTION: BINDS IL-13 WITH A LOW AFFINITY. TOGETHER WITH IL-4R-ALPHA CAN FORM A FUNCTIONAL RECEPTOR FOR IL-13. ALSO SERVES AS AN ALTERNATE ACCESSORY PROTEIN TO THE COMMON CYTOKINE RECEPTOR GAMMA CHAIN FOR IL-4 SIGNALING, BUT CANNOT REPLACE THE FUNCTION OF GAMMA-C IN ALLOWING ENHANCED IL-2 BINDING ACTIVITY.

SUBUNIT: INTERLEUKIN-13 RECEPTOR IS A COMPLEX OF IL4R-ALPHA,
